MOB Version 1.0 Released for Licensing

Application developers increase the value of their software using MOB

VANCOUVER, British Columbia – Bits Republic Technologies, Inc has released version 1.0 of the My Own Bits™ (or MOB) platform for licensing to software developers. The license will provide added revenue to software providers while increasing value to their users. The MOB platform uses proprietary technology to allow data to be reliably shared and securely stored through the internet while maintaining privacy and full control of the data in the hands of the owner. MOB is so secure that only data owners and their approved users can view the information; the software provider, anonymous users and Bits Republic are unable to view it. The ability to access data 24/7 by any approved client even without an Internet connection allows time-critical data to be stored on the MOB platform.

The need for businesses to share information securely and privately with clients has been an ongoing challenge. Sharing and storage technologies are available but they are unaffordable or technologically complex for most businesses to install and operate. Therefore, many professional service businesses, like legal offices, continue to use unencrypted e-mail to share client information. Online storage and online sharing services are affordable and proliferating but the information stored there is accessible by unauthorized parties or to the storage host itself, making businesses reluctant to use these services.

Charles Chung, founder and president of Bits Republic states: “We are excited to provide this unique product for application developers who have clients that need to store and share information securely across the internet. MOB opens up the market to allow anyone to share data securely with several people and not just businesses with resources.” Mr. Chung also adds that the technology is very cost effective and easy to integrate into any application.

Bits Republic Technologies, Inc., founded in 2007, is based in Burnaby British Columbia, Canada. The goal of this company is to develop secure information sharing technology through the Internet and bringing privacy to documents shared over the Internet.
